Winter Quarter SRC Data

Professor Pippy Pee-Pee Diarrheastein Poopypants Esquire[a]
[a]University of California, Riverside

Abstract. This document explores the ”live data” the University of California, Riverside’s (UCR) Student Recreation Center (SRC) provides on their website from Winter Quarter 2026. The data collected aims to answer the questions of the average occupancy of the SRC at a given time and day the optimal time to go to the SRC for each day, and other relevant trends retaining to the SRC. This document hopes to improve the productivity of the SRC and the schedule of UCR students and faculty.

1 Introduction/ Motivation

Have you ever asked what time would be best to go to the gym today? The answer should be no and if you said yes, I know you’re lying. The idea of the project came about around July 2025 when I was at work at my cashier job. I remembered a live count website provided by the SRC and wanted to see what data I could collect just because it sounded pretty interesting (You can tell my job was very exciting because I was more enthusiastic about the idea than what I got paid for). There isn’t any data or report published anywhere throughout my time at UCR regarding this website, nor do I believe his website was used to its fullest potential by students and faculty. I really don’t blame them because you would have to either A. search up the website itself (lot’s of clicking) or B. try to read the data with atrocious UI provided by the SRC app and this assumes that the SRC staff updated the website in the last thirty minutes and on top of that you know what location of the gym you were looking for (not machine mind you or equipment, location). This document aims to provide a use for the live count website; so you, reader, never have to look at it ever.

2 Methodology

2.1 Data Acquistion

The website used for this project is the Live Facility Count from the SRC website.

https://recreation.ucr.edu/live-counts

Each location has the following bits of information: the name of the location, whether or not that location is open, the last count of how many people were at that location, the last time the information was updated, and the percentage of last count divided by the maximum amount of people allowed at the location. The SRC uses Connect2Concepts to record each location. There are 42 locations that the SRC records;however, 2 locations are duplicates (Pool and Pool Deck). Therefore, the SRC records 40 unique locations. The first AutoIt script figured out the positions on the screen I need to click, highlight and paste automatically. I used the following hyperlinked script (Click Here for Code)

Then, from 6:30AM to to 11:00 PM (23:00)on Mondays through Thursdays, 6:30AM to 7:00 PM (19:00) on Fridays, 3:00PM (15:00) to 7:00 PM (19:00) on Saturdays, and 3:00PM (15:00) to 11:00PM (23:00) at every half hour, my host computer ran the following AutoIt code to retrieve the information from the website autonomously. (Click Here for Code)

This information retrieved would be saved as a CSV file. All successfully processed CSV files look like this. At the end of the day, I would store every downloaded file into a folder labeled as that day, and delete all files that failed to process anything. Overall, I processed 1516 CSV files.

Fig 1 Raw CSV file in Visual Studio Code.

2.2 Data Organization

I had many iterations of how to organize my data, each iteration improving productivity.

2.2.1 Manual Entry

The first iteration required me to manually compare files. The left side of the sheet would contain the older file and the right side would contain the newer file. I also had sheets for each location of the SRC store their individual data. On the farthest right column would indicate if the older file matched the newer file for that row, and there would be an overall indicator if the older and newer file matched. If theleft side of row did not match with the right side, I copied the contents of the newer file for that row and appended it to the sheet the row corresponded to. This process would

																Mismatch

Fig 2 First setup to organize data manually.

continue until the final indicator marked true. Here is the excel equation per row =IF(AND(C?=K?,D?=L?,E?=M?,F?=N?,H?=P?),”Match”,”Mismatch”) (used to check if old file matches new file for that row)

=IF(COUNTA(Q2:Q43)=COUNTIF(Q2:Q43,Q2),”All Match”,”Mismatch”) (used to check if there are mismatches)

This process would take me around 5 minutes to get through one file. To process all 1516 files, it would take me an estimated 126 hours to fully process all of the files.

2.2.2 *Semi Automatic Entry*

Because the previous iteration would take too much time, I decided to increase productivity using Google Apps Scripts to organize my files. I didn't fully trust fully automating the organization process yet so I decided to paste the file onto a dedicated sheet, and then run the Google Apps Script to check through all the rows of the file and see if it matches any rows that I already have. I have a second sheet to see whether or not the script is running as I made it automatic for every edit on the sheet I inserted a file to check. Here is the code. (Click Here for Code)

This process would take around 35 seconds to get through one file. To process all 1516 files, it would take me an estimated 14 hours to fully process all of the files

2.2.3 *True Automatic Entry*

After finding success with Google Apps Scripts but also realizing that this process takes too much time, I decided to automate the entire organization process. I created a separate sheet to see whether or not my code worked and the true automatic code was able to input sheet with little issues. I imported all of the data onto Google Drive to make it possible. Here is the code that imported the data from the Google Drive. (Click Here for Code) Then, I had to run another script to organize the rows by dates since my original Google Apps Scripts didn't do that. Here is the code to standardize the dates. (Click Here for Code). Here the code to sort by date. (Click Here for Code) After some manual cleaning of data, I added the day of the week the row corresponded to, though it seems I lost the code for that.

This process took around 5 minutes for 300 files, so on average a second per file. However, because of my free use of Google Apps Script, I had to make sure the code did not run for 6 minutes or it would timeout and I would have to start over again with a smaller data batch. To fully process all

of 1516 files, it would take me an estimated 35 minutes to process all of the files with adding days of the week to each entry further manual organization.

2.3 Limitations

Only one person did this project. A lot of mistakes could be found because no one else double checked my work. As someone with a life outside doing this project, there would be times where I could not acquire data because when refreshing the page through the ”Refresh Count” button, it sometimes does not load any new data and instead produces a blank screen. I don’t know why this happens, but it would cost days of data. Using the browser refresh instead would most likely fix this problem (I used Google Chrome for this project).

Another problem with this data set is that it is a discrete set of points rather than a continuous set. The SRC simply does not have the ability to produce a continuous set. As people continue to move around the gym, the SRC staff can only count an instance of how many people are in that location. Furthermore, SRC staff also walk from location to location to record the data and then publish the data. Finally, all of the numbers are solely based on what the SRC staff counts, there’s always a possibility that they miscount.

For my true automatic code, I ran into a few issues when processing and organizing data. First, the last entries for 1/9/2026 got corrupted such that they got processed as ”1/9/26” instead of ”01/9/26”. Second, there was a double entry for points at 21:03 for 1/15/26 so I had to remove those duplicates. Lastly, sometimes if I were to run the true automatic code twice for the same data set, it would be inputted twice, so I had to make sure that I ran the code once.

3.2 Discussion

As expected, less people go to the SRC when it opens, with more people going later in the day. This trend makes sense because clubs tend to schedule their events later in the day. However, this trend persists in locations that clubs do not host at, such as the weight rooms and the power training platforms. Another trend that I took interest is that less people go to the SRC as the quarter progresses. As Winter Quarter tends to be the quarter where people try to act on their New Year's resolutions and as more events happen outside of the SRC, going to the SRC becomes less of a priority. Moreover, despite the workers at the SRC seem to be gossiping all the time, they do their job (for the most part). If any higher up at the SRC is reading this document, I suggest to not fire any workers, but maybe instead train them, if you aren't happy with the average recording data time.

4 Conclusion

Do I expect to change when you go to the SRC? No, I shouldn't be telling what you should be doing (also some of you readers might not even go to UCR). Will I also be continuing this project for future quarters? Also no. Unfortunately, I want to move on to other projects. I also did not enjoy how I made my computer into a mini data center. There is a ton of ethical concerns if I were to collect more than SRC data. But I've made all of my code and data for this project pubilcly available on the Github repository I provide in the beginning of the document. If you want to continue collecting data and/or optimize any code/data that I provided, I give full permission to do so. Besides, most of the code was vibe coded so it definitely could be improved by a human. Other universities, such as UCSB and UCLA, also use Connect2Concepts to disclose their gym data as well. Hopefully the trends displayed at the SRC are also present in other non university gyms.

Acknowledgments

Thank you to my brother for allowing me to use his computer as a data center for this project. Thank you to all my Sam Altman and Anthropic for literally doing all the hard work of the project for me. And lastly, thank you reader for (hopefully) reading through the entire document.

Professor Pippy Pee-Pee Diarrheastein Poopypants Esquire is a professor at the University of California, Riverside. He was born in 1936 in New Swissland. He created the Goosy-Grow 4000 and the Shrinky-Pig 2000. He worked at Jerome Horwitz Elementary School in Piqua, Ohio as a science teacher.

List of Figures

1 Raw CSV file in Visual Studio Code.

2 First setup to organize data manually.

3 Average Occupancy on Mondays, Tuesdays and Wednesdays.

4 Average Occupancy on Thursdays, Fridays and Saturdays.

5 Average Occupancy on Sundays.

6 Average Recording Interval Per Location.

7 Max Occupancy during Winter Quarter.
